

NEXUS 2.0 · current technical flow

Only what the code runs today. Follow the numbers. Role on each chip, the library or protocol under it.

1 Touchpoints

Where work arrives and where the person stays in control

5

Assembly workbench

Where a flow gets built and packaged

- Chat and upload
React · multipart
- Generated config panel
from each skill schema
- Canvas edit, then re-sync
React Flow
- Preview and confirm
session must be confirmed
- Package into the library

6

Context fabric

What a decision can cite

- Parse and infer schema
pandas · pypdf
- Chunk the documents
heading-aware split
- Extract typed facts
LLM, pinned to a chunk
- Lexical retrieval
token overlap, top passages
- Session knowledge file
JSON, dies with the session

2 Orchestration · understand, then assemble and run

The model fills typed values. Python builds the graph, so the same answers always produce the same flow.

3 Five specialist skills · the only things that touch the data

Each skill is a registered class plus a YAML behaviour file. They never call each other — they emit an envelope.
